

# Advanced SOC Incident Investigation Report

---

## Executive Summary

A simulated cyber-attack was performed on a vulnerable system to evaluate the effectiveness of the Security Operations Centre (SOC). The attack was detected through monitoring tools, and immediate actions were taken to analyse, contain, and mitigate the threat. The incident was escalated appropriately for further investigation.

### Incident Timeline

- 14:00 — Suspicious exploitation activity detected
- 14:05 — Alert triage initiated
- 14:10 — Threat intelligence validation completed
- 14:15 — System isolated from network
- 14:25 — Attacker IP blocked and escalation performed

## Detection and Analysis

The monitoring system detected abnormal activity associated with a known vulnerability exploitation attempt. Correlation of logs and threat intelligence data confirmed malicious intent. The attack was mapped to MITRE ATT&CK technique T1210 (Exploitation of Remote Services).

## Response and Containment

The affected system was immediately isolated to prevent lateral movement. Network-level controls were applied to block the attacker's IP. Endpoint security scans were conducted to ensure no persistence remained.

## Escalation

Due to the severity of the incident, it was escalated to Tier 2 analysts for deeper investigation. A detailed case summary was prepared and shared through the incident management system.

## Recommendations

It is recommended to apply regular security patches, enhance monitoring capabilities, and integrate threat intelligence feeds to improve detection accuracy. Continuous SOC training and awareness programs are also advised.
