

Adversary Emulation Report – Phishing Attack Simulation

Section 1 — Simulation Overview

A simulated phishing attack was conducted using adversary emulation techniques to test the SOC detection and response capabilities.

Section 2 — Emulation Details

Timestamp	TTP (MITRE)	Detection Status	Notes
2025-08-18 17:00:00	T1566 (Phishing)	Detected	Phishing email successfully identified

Section 3 — Analysis

The SOC monitoring system successfully detected the simulated phishing attack. Alerts were generated and analysed by the SOC team, demonstrating effective detection capabilities.

Section 4 — Gaps Identified

Minor delays were observed in alert response time. Improvements in automation and alert prioritization can enhance detection efficiency.

Section 5 — Conclusion (100 words approx.)

The adversary emulation exercise demonstrated the SOC team's ability to detect phishing attacks effectively. However, improvements in response time and automation are required to strengthen the overall security posture. Continuous testing using adversary emulation is recommended.
