

Threat Hunting Report – Privilege Escalation Detection

Section 1 — Hypothesis

Hypothesis:
Unauthorized privilege escalation activity may be occurring within the system using valid accounts (MITRE ATTACK T1078).

Section 2 — Log Analysis Table

Timestamp	User	Event ID	Notes
2025-08-18 15:00:00	Test user	4672	Unexpected admin privileges assigned
2025-08-18 15:05:00	Admin user	4672	Privileged role used at unusual time

Section 3 — Analysis

Log analysis revealed multiple instances of privileged account usage (Event ID 4672). The activity appears abnormal due to unusual timing and unexpected privilege assignments. This suggests potential misuse of valid accounts.

Section 4 — Threat Intelligence Correlation

Threat intelligence sources such as AlienVault OTX were used to validate suspicious activity patterns. Indicators suggest possible credential misuse aligned with MITRE ATTACK technique T1078.

Section 5 — Conclusion (100 words approx.)

The threat hunting activity identified suspicious privilege escalation behaviour within the system. Correlation of logs and threat intelligence indicates potential misuse of valid accounts. Immediate monitoring and access control review is recommended to prevent further unauthorized actions. This activity aligns with MITRE ATTACK technique T1078 and highlights the need for proactive threat hunting.
